

Type Soundness in an Intensional Dependent Type Theory with Type-in-Type and Recursion

February 28, 2021

1 Type Soundness

1.1 Contexts

1.1.1 Sub-Contexts are well formed

The following rules are admissible:

$$\begin{array}{c} \frac{\Gamma, \Gamma' \vdash}{\Gamma \vdash} \\[1em] \frac{\Gamma, \Gamma' \vdash m : M}{\Gamma \vdash} \\[1em] \frac{\Gamma, \Gamma' \vdash m \Rightarrow m' : M}{\Gamma \vdash} \\[1em] \frac{\Gamma, \Gamma' \vdash m \Rightarrow_* m' : M}{\Gamma \vdash} \\[1em] \frac{\Gamma, \Gamma' \vdash m \equiv m' : M}{\Gamma \vdash} \end{array}$$

by mutual induction on the derivations.

1.1.2 Context weakening

For any derivation of $\Gamma \vdash M : \star$, the following rules are admissible:

$$\begin{array}{c} \frac{\Gamma, \Gamma' \vdash}{\Gamma, x : M, \Gamma' \vdash} \\[1em] \frac{\Gamma, \Gamma' \vdash n : N}{\Gamma, x : M, \Gamma' \vdash n : N} \\[1em] \frac{\Gamma, \Gamma' \vdash n \Rightarrow n' : N}{\Gamma, x : M, \Gamma' \vdash n \Rightarrow n' : N} \end{array}$$

$$\frac{\Gamma, \Gamma' \vdash n \Rightarrow_* n' : N}{\Gamma, x : M, \Gamma' \vdash n \Rightarrow_* n' : N}$$

$$\frac{\Gamma, \Gamma' \vdash n \equiv n' : N}{\Gamma, x : M, \Gamma' \vdash n \equiv n' : N}$$

by mutual induction on the derivations.

1.1.3 \Rightarrow is reflexive

The following rule is admissible:

$$\frac{\Gamma \vdash m : M}{\Gamma \vdash m \Rightarrow m : M} \Rightarrow\text{-refl}$$

by induction

1.1.4 Context substitution

For any derivation of $\Gamma \vdash m : M$ the following rules are admissible:

$$\frac{\Gamma, x : M, \Gamma' \vdash}{\Gamma, \Gamma' [x := m] \vdash}$$

$$\frac{\Gamma, x : M, \Gamma' \vdash n : N}{\Gamma, \Gamma' [x := m] \vdash n [x := m] : N [x := m]}$$

$$\frac{\Gamma, x : M, \Gamma' \vdash n \Rightarrow n' : N}{\Gamma, \Gamma' [x := m] \vdash n [x := m] \Rightarrow n' [x := m] : N [x := m]}$$

$$\frac{\Gamma, x : M, \Gamma' \vdash n \Rightarrow_* n' : N}{\Gamma, \Gamma' [x := m] \vdash n [x := m] \Rightarrow_* n' [x := m] : N}$$

$$\frac{\Gamma, x : M, \Gamma' \vdash n \equiv n' : N}{\Gamma, \Gamma' [x := m] \vdash n [x := m] \equiv n' [x := m] : N [x := m]}$$

by mutual induction on the derivations. Specifically, at every usage of x from the var rule in the original derivation,

- replace the usage of the Var rule with the derivation of $\Gamma \vdash m : M$ weakened to the context of $\Gamma, \Gamma' [x := m]$
- similarly for the Var- \Rightarrow rule replace with the derivation of $\Rightarrow\text{-refl}$, at $\Gamma \vdash m \Rightarrow m : M$ weakened to the context of $\Gamma, \Gamma' [x := m]$

1.2 Computation

1.2.1 \Rightarrow preserves type of source

The following rule is admissible:

$$\frac{\Gamma \vdash m \Rightarrow m' : M}{\Gamma \vdash m : M}$$

by induction

1.2.2 \Rightarrow -substitution

The following rule is admissible:

$$\frac{\Gamma, x : M, \Gamma' \vdash n \Rightarrow n' : N \quad \Gamma \vdash m \Rightarrow m' : M}{\Gamma, \Gamma' [x := m] \vdash n [x := m] \Rightarrow n' [x := m'] : N [x := m]}$$

by induction on the \Rightarrow derivations

1.2.3 \Rightarrow is confluent

if $\Gamma \vdash m \Rightarrow n : M$ and $\Gamma \vdash m \Rightarrow n' : M$ then there exists m' such that

$$\Gamma \vdash n \Rightarrow m' : M \text{ and } \Gamma \vdash n' \Rightarrow m' : M$$

by standard techniques, outlined in the agda development

1.3 \Rightarrow_*

1.3.1 \Rightarrow_* is transitive

The following rule is admissible:

$$\frac{\Gamma \vdash m \Rightarrow_* m' : M \quad \Gamma \vdash m' \Rightarrow_* m'' : M}{\Gamma \vdash m \Rightarrow_* m'' : M} \Rightarrow_*\text{-trans}$$

by induction

1.3.2 \Rightarrow preserves type in destination

$$\frac{\Gamma \vdash m \Rightarrow m' : M}{\Gamma \vdash m' : M}$$

By induction on the \Rightarrow derivation with the help of the substitution lemma.

- $\Pi\text{-}\Rightarrow$

- $m' [x := n', f := (\text{fun } f. x.m')] : M' [x := n']$ by the substitution lemma used on the inductive hypotheses
- $M [x := n] \Rightarrow M' [x := n']$ by \Rightarrow -substitution, so $M [x := n] \equiv M' [x := n']$
- by the conversion rule $m' [x := n', f := (\text{fun } f. x.m')] : M [x := m]$

- $\Pi\text{-E-}\Rightarrow$

- $m' n' : \tau [x := n']$, by \Rightarrow -substitution and reflexivity, $M [x := n] \Rightarrow M [x := n']$, so $M [x := n] \equiv M [x := n']$
- by the conversion rule $m' n' : M [x := n]$
- Π -I- \Rightarrow
 - $\text{fun } f.x.m' : \Pi x : M'.N', \Pi x : M.N \Rightarrow \Pi x : M'.N'$, so $\Pi x : M.N \equiv \Pi x : M'.N'$
 - by the conversion rule $\text{fun } f.x.m' : \Pi x : M.N$
- all other cases are trivial

1.3.3 \Rightarrow_* preserves type

The following rule is admissible:

$$\frac{\Gamma \vdash m \Rightarrow_* m' : M}{\Gamma \vdash m : M}$$

by induction

$$\frac{\Gamma \vdash m \Rightarrow_* m' : M}{\Gamma \vdash m' : M}$$

by induction

1.3.4 \Rightarrow_* is confluent

if $\Gamma \vdash m \Rightarrow_* n : M$ and $\Gamma \vdash m \Rightarrow_* n' : M$ then there exists m' such that

$$\Gamma \vdash n \Rightarrow_* m' : M \text{ and } \Gamma \vdash n' \Rightarrow_* m' : M$$

Follows from \Rightarrow *-trans and the confluence of \Rightarrow using standard techniques, outlined in the agda development

1.3.5 \equiv is an equivalence

The following rule is admissible:

$$\frac{\Gamma \vdash m : M}{\Gamma \vdash m \equiv m : M} \equiv\text{-refl}$$

by \Rightarrow *-refl

The following rule is admissible:

$$\frac{\Gamma \vdash m \equiv m' : M}{\Gamma \vdash m' \equiv m : M} \equiv\text{-sym}$$

trivial.

The following rule is admissible:

$$\frac{\Gamma \vdash m \equiv m' : M \quad \Gamma \vdash m' \equiv m'' : M}{\Gamma \vdash m \equiv m'' : M} \equiv\text{-trans}$$

by the confluence of \Rightarrow_*

1.3.6 \equiv preserves type

The following rules are admissible:

$$\frac{\Gamma \vdash m \equiv m' : M}{\Gamma \vdash m : M}$$

$$\frac{\Gamma \vdash m \equiv m' : M}{\Gamma \vdash m' : M}$$

by the def of \Rightarrow_*

1.3.7 Regularity

The following rule is admissible:

$$\frac{\Gamma \vdash m : M}{\Gamma \vdash M : \star}$$

by induction with \equiv -preservation for the Conv case

1.3.8 \rightsquigarrow implies \Rightarrow

For any derivations of $\Gamma \vdash m : M$, $m \rightsquigarrow m'$

$$\Gamma \vdash m \Rightarrow m' : M$$

by induction on \rightsquigarrow

1.3.9 \rightsquigarrow preserves type

For any derivations of $\Gamma \vdash m : M$, $m \rightsquigarrow m'$,

$$\Gamma \vdash m' : M$$

since \rightsquigarrow implies \Rightarrow and \Rightarrow preserves types

1.4 Type constructors

1.4.1 Type constructors are stable

- if $\Gamma \vdash * \Rightarrow m : M$ then m is $*$
- if $\Gamma \vdash * \Rightarrow_* m : M$ then m is $*$
- if $\Gamma \vdash \Pi x : N. P \Rightarrow m : M$ then m is $\Pi x : N'. P'$ for some N', P'
- if $\Gamma \vdash \Pi x : N. P \Rightarrow_* m : M$ then m is $\Pi x : N'. P'$ for some N', P'

by induction on the respective relations

1.4.2 Type constructors definitionally unique

There is no derivation of $\Gamma \vdash * \equiv \Pi x : M.N : P$ for any Γ, M, N, P
from \equiv -Def and constructor stability

1.5 Canonical forms

If $\Diamond \vdash v : P$ then

- if P is \star then v is \star or $\Pi x : M.N$
- if P is $\Pi x : M.N$ for some M, N then v is $\text{fun } f. x.m$ for some m

By induction on the typing derivation

- Conv,
 - if P is \star then eventually, it was typed with type-in-type, or Π -F. it could not have been typed by Π -I since constructors are definitionally unique
 - if P is $\Pi x : M.N$ then eventually, it was typed with Π -I. it could not have been typed by type-in-type, or Π -F since constructors are definitionally unique
- type-in-type, $\Diamond \vdash v : P$ is $\Diamond \vdash \star : \star$
- Π -F, $\Diamond \vdash v : P$ is $\Diamond \vdash \Pi x : M.N : \star$
- Π -I, $\Diamond \vdash v : P$ is $\Diamond \vdash \text{fun } f. x.m : \Pi x : M.N$
- no other typing rules are applicable

1.6 Progress

$\Diamond \vdash m : M$ implies that m is a value or there exists m' such that $m \rightsquigarrow m'$.

By direct induction on the typing derivation with the help of the canonical forms lemma

Explicitly:

- m is typed by the conversion rule, then by **induction**, m is a value or there exists m' such that $m \rightsquigarrow m'$.
- m cannot be typed by the variable rule in the empty context
- m is typed by type-in-type. m is \star , a value
- m is typed by Π -F. M is $\Pi x : N.P$, a value
- m is typed by Π -I. m is $\text{fun } f. x.n$, a value

- m is typed by Π -E. M is $p\ n$ then exist some σ, τ for $\Diamond \vdash P : \Pi x : \sigma. \tau$ and $\Diamond \vdash N : \sigma$. By **induction** (on the P branch of the derivation) P is a value or there exists P' such that $P \rightsquigarrow P'$. By **induction** (on the N branch of the derivation) N is a value or there exists N' such that $N \rightsquigarrow N'$
 - if P is a value then by **canonical forms**, P is $\text{fun } f : (x.\tau). x : \sigma. P'$ and
 - * if N is a value then the one step reduction is $(\text{fun } f : (x.\tau). x : \sigma. P')\ N \rightsquigarrow P'[x := N, f := \text{fun } f : (x.\tau). x : \sigma. M]$
 - * otherwise there exists N' such that $N \rightsquigarrow N'$, and the one step reduction is $(\text{fun } f : (x.\tau). x : \sigma. P')\ N \rightsquigarrow (\text{fun } f : (x.\tau). x : \sigma. P')\ N'$
 - otherwise, there exists P' such that $P \rightsquigarrow P'$ and the one step reduction is $P\ N \rightsquigarrow P'\ N$
- m is typed by $::$, m is $n :: N$ by induction
 - n is a value, $n :: N \rightsquigarrow n$
 - or there exists n' such that $n \rightsquigarrow n'$, $n :: N \rightsquigarrow n' :: N$

1.7 Type Soundness

For any well typed term in an empty context, no sequence of small step reductions will cause a computation to “get stuck”. Either a final value will be reached or further reductions can be taken. This follows by iterating the progress and preservation lemmas.
